

As part of our Science work on Materials, Year 2 took part in an investigation to find a material that would make a good umbrella and a material that would make a silly umbrella.

We made sure our test was fair by using pipettes to add a drop of water at a time. We recorded how many drops of water each material was able to hold before it leaked. Some materials were waterproof so we knew these would be good for making an umbrella.

We decided that waterproof fabric and a plastic table cover would make a good umbrella. Our silly umbrella material was tissue as it leaked very quickly and became soggy.
